Lab 2 React Reflection

1. Expo Snack allows for users to quickly create a usable, bare minimum development environment for creating React apps without any command-line use or installing packages so people with more beginner knowledge can still learn React. It also allows for quick testing of features or components.
2. Developing in a web browser differs from local development in a few ways. First, compilation is not done on your local machine and handled by a server somewhere else. Secondly, no files are stored locally when you develop in a web browser unless you intentionally export it or otherwise save it. Third, the performance of your app may be faster or more efficient when developing on a web browser as the functionality of your app is being run on a very powerful computer.
3. Registering and downloading the Expo Dev and Expo Go apps was really easy, no hiccups there for me. However whenever I am using a new IDE or development environment for the first time I always have some difficulties adjusting to the new layout, functionality and design of the given software. It never takes me before it becomes part of my muscle memory again.
